Listing of Claims

The following listing of claims will replace all prior versions, and listings, of claims in the subject application:

- 1. (currently amended) An ink jet printing device comprising:
- a head unit in which a plurality of recording heads having discharge nozzles which discharge ink drops of different colors respectively are arranged in a main scanning direction, and the discharge nozzles of each of the recording heads are arranged at equal intervals in a subscanning direction which is perpendicular to the main scanning direction;
- a head-unit moving unit moving the head unit in the main scanning direction along a printing region of a recording medium;
- a recording-medium moving unit moving the recording medium in the sub-scanning direction; and
- a control unit controlling the head unit, the head-unit moving unit, and the recording-medium moving unit,

wherein the control unit is configured to carry out printing procedures including steps of moving the recording medium to the printing region to perform the discharging of the ink drops, and moving the recording medium in the sub-scanning direction by an interval represented by the formula H/k where H is an array interval of the discharge nozzles in the sub-scanning direction and k is an integer [[above]] greater than one, to perform the discharging of the ink drops to a non-printed region equivalent to the array interval H of the discharge nozzles, and configured to repeat the printing procedures k times according to an ink dot density, and thereafter move the recording medium in the sub-scanning direction so that the head unit is located to a next non-

printed region following the printing region and the printing procedures are performed for the next non-printed region,

wherein the control unit is configured so that a rear-end portion of the discharge nozzles of the kth printing procedure in an array direction after printing of the printing region and a front-end portion of the discharge nozzles of the kth printing procedure in the array direction before printing of the non-printed region overlap each other with respect to the sub-scanning direction, and invalid nozzles that do not discharge the ink drops are determined from among arbitrary ones of the everlapping discharge nozzles including the in the overlap between said front-end portion and [[the]] said rear-end portion in the array direction of the discharge nozzles.

- 2. (currently amended) The ink jet printing device according to claim 1 wherein the control unit is configured to determine as being the invalid nozzles at least one of the discharge nozzles located in the rear-end portion in the array direction upon a final movement of the head unit in the main scanning direction for printing in the same said printing region and one of the discharge nozzles located in the front-end portion in the array direction upon a first movement of the head unit in the main scanning direction for printing in the non-printed region.
- 3. (currently amended) The ink jet printing device according to claim 2 wherein, when [[the]] k corresponding to a number [[k]] of repetitions of the movement of the recording medium by the interval represented by H/k in the sub-scanning direction is increased, the control unit is configured to determine as being the invalid nozzles at least one of the discharge nozzles located in the front-end portion in the array direction upon each of movements of the

head unit, except for a final movement, in the main scanning direction for printing in the non-printed region.

- 4. (currently amended) The ink jet printing device according to claim 1 wherein, when [[the]] a number of the overlapping discharge nozzles in said overlap is increased, the control unit is configured to increase [[the]] a number of the invalid nozzles.
- 5. (currently amended) An image forming apparatus in which an ink jet printing device is provided, the ink jet printing device comprising:
- a head unit in which a plurality of recording heads having discharge nozzles which discharge ink drops of different colors respectively are arranged in a main scanning direction, and the discharge nozzles of each of the recording heads are arranged at equal intervals in a subscanning direction which is perpendicular to the main scanning direction;
- a head-unit moving unit moving the head unit in the main scanning direction along a printing region of a recording medium;
- a recording-medium moving unit moving the recording medium in the sub-scanning direction; and
- a control unit controlling the head unit, the head-unit moving unit, and the recording-medium moving unit,

wherein the control unit is configured to carry out printing procedures including steps of moving the recording medium to the printing region to perform the discharging of the ink drops, and moving the recording medium in the sub-scanning direction by an interval represented by the formula H/k where H is an array interval of the discharge nozzles in the sub-scanning

direction and k is an integer [[above]] greater than one, to perform the discharging of the ink drops to a non-printed region equivalent to the array interval H of the discharge nozzles, and configured to repeat the printing procedures k times according to an ink dot density, and thereafter move the recording medium in the sub-scanning direction so that the head unit is located to a next non-printed region following the printing region and the printing procedures are performed for the next non-printed region,

wherein the control unit is configured so that a rear-end portion of the discharge nozzles of the kth printing procedure in an array direction after printing of the printing region and a front-end portion of the discharge nozzles of the kth printing procedure in the array direction before printing of the non-printed region overlap each other with respect to the sub-scanning direction, and invalid nozzles that do not discharge the ink drops are determined from among arbitrary ones of the overlapping discharge nozzles including [[the]] in the overlap between said front-end portion and [[the]] said rear-end portion in the array direction of the discharge nozzles.
